

PEDESTAL BACK SUPPORT POCKETS

IMPROVED BOTTLE CONTROL

Pedestal Back Support Pockets are a feature designed by Fogg to elevate the performance above and beyond the competition for uptime and reliability. Each Pedestal Back Support Pocket is carefully designed to the customer's container to create a smoother and cleaner system. Some are made adjustable to accommodate more than one bottle.

OVERCOMES VACUUM LOCKING

They can provide needed neck support for light weight PET containers

They provide positive placement on the filler carousel improving performance during filling and transferring to the capper.

They also provide positive pressure for removal from the filling valves when vacuum locking occurs, which in most cases eliminates the spilling associated with it.

They aid the Fogg "recovery trough" system to open valves for CIP, flavor changes, and temperature management.

MINIMUM CHANGEOVER TIME

In almost every application Fogg has found that the introduction of this feature improves line efficiency, putting more revenue into the hands of our customers.
