

# Seismic Safety Tray

## How It Works

The stainless steel tray (pictured below, upside down) is placed underneath the bottom rack. In an earthquake, the tray's plastic slides, when resting on a polished floor, will slide against the movement of the earth, decreasing sway and making both your barrels and your employees safer.

## Easy Attachment

Move the rack without losing the Safety Tray by deploying the spring loaded attaching bar with the flick of a finger. Pull the bar and flip it sideways when you need to detach again.
