

 greencap®

A sustainable
packaging
solution for the
wine industry.

 Blossom
sustainable closures

 *Guala Closures Group*

How does Greencap® works?

Greencap® is an innovative ROPP that allows safe separation of aluminium and glass after use.

Removability and TE functionality are guaranteed thanks to a special patented neck finish featuring three crossed threads; the closure breaks always the (thinner) bridges at the first opening.

For the application of Greencap® a special rolling head with 6 threader rollers is needed.

What is Greencap® ?

GREENCAP® is the green evolution on ROPP

Consumers are now able to safely separate glass and aluminum reducing package environmental impact.

How Greencap® interacts with final consumer?

Greencap® is now available with integrated QR code to offer you:

Purchasing verification (internal code)

Consumer Engagement

Recycling info/instructions

Can Greencap® seal any kind of beverage?

Depending on the type of liner or wad used, Greencap® can seal any kind of beverage such as any standard ROPP.

(i.e. still or sparkling wine, spirits, etc.)

Why switch from standard ROPP to Greencap® ?

Aluminium is a material with impressive sustainability credentials. It is widely available and, through recycling, saves a lot of energy.

About 75% of the aluminium ever produced is still in use today.

Aluminum made by recycling process needs 1 kWh instead of 13 kWh for normal production.

Only in Europe, aluminium closures recycling rate reaches already 45% today. This figure can be improved by switching to Greencap® as simple separation and clear collection are easier for consumers.

Close to a better future
