

THE ONGUARD SERVICE

ONGUARD is an integrated system of tank, anchorage, foundation and connected infrastructure. We can take a lead role in the design space, bringing together other partners and professionals to ensure each part of the system works in structural harmony with the others. Alternatively, we can empower you to undertake your design in-house using our specially developed Mohawk® design software which requires minimal training.

This is conveyed in the form of detailed design documentation and specifications produced by ONGUARD and its partners.

As a standard, we also provide the Tygr Eye® telemetric seismic monitoring system. Tygr Eye® minimizes the need for physical inspections and reinstatement times by detecting movement and giving immediate feedback after an earthquake. The feedback will include the condition of the sacrificial fuses within each anchor and whether any need to be replaced.
